Oasis 2x4 Method: Proof of Concept

Waters Corporation

This is an Application Brief and does not contain a detailed Experimental section.

Abstract

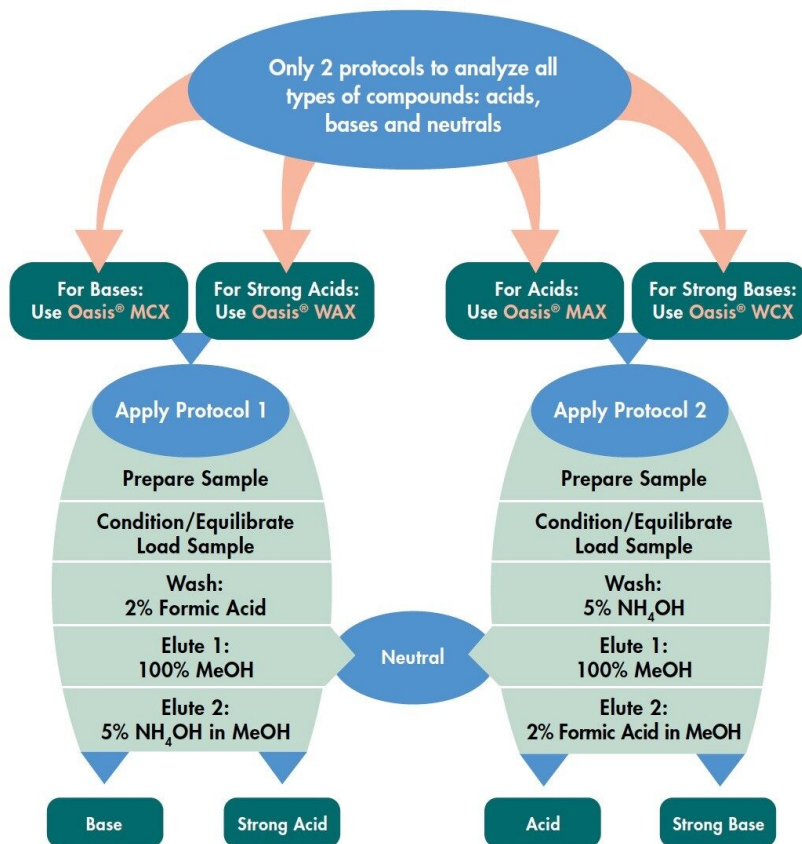

This application brief highlights Oasis 2x4 Method which is a viable approach to SPE sorbent and protocol selection.

Introduction

In order to prove that the Oasis 2x4 Method is a viable approach to SPE sorbent and protocol selection, a group of representative small molecules was spiked into rat plasma. The molecules include a base, a quaternary ammonium salt, a neutral, an acid and a strong acid. The spiked plasma samples were then extracted following the Oasis 2x4 Method. All molecules elute in the correct Elute 1 or Elute 2 fractions according to what theory predicted, proving that the method is viable.

Follow the simple steps outlined in this flow chart to achieve high recoveries and the cleanest extracts:

- Characterize your analyte [Neutral, Acid or Base, pKa].
- Select one of the four Oasis sorbents.
- Apply the indicated Protocol [1 or 2].
- Determine SPE recoveries by LC analysis.
