

Oasis™ PRiME HLB Solid Phase Extraction for High Bioanalytical Plasma Analyte Recovery and Low Matrix Effects of Top-Selling Pharmaceuticals

Mary Trudeau, Margot Lee

Waters Corporation

Abstract

The following work demonstrates a simple, generic, and broadly applicable sample preparation method, requiring no method development, for the extraction of several top-selling pharmaceutical small molecule therapeutic drugs from plasma using Oasis PRiME HLB reversed-phase solid phase extraction (SPE) and subsequent LC-MS/MS quantification.

Benefits

- Simplified bioanalytical sample preparation strategy, requiring no method development for successful analyte extraction from plasma
- Simple 3-step SPE protocol, yielding high analyte recovery and low matrix effects, with no optimization required
- Removal of more than 90% phospholipids as compared to traditional SPE, resulting in cleaner extracts
- SPE extraction (<30 minutes) using the 96-well µElution SPE extraction plate format

- Fast, 3-minute UPLC-MS analysis using the ACQUITY™ I-Class Plus UPLC™, ACQUITY HSS T3 Column and Xevo™ TQ-XS Mass Spectrometer
- Excellent quantitative performance achieving accuracy and repeatability of $\pm 15\%$ from plasma

Introduction

With continued research and development of next generation therapies and generic pharmaceutical equivalents, there is continued need for their robust, sensitive, and selective bioanalytical sample preparation and liquid chromatography mass spectrometry (LC-MS) methods for their accurate quantitation from biological matrices. However, developing robust bioanalytical methods can be quite challenging, with sample preparation often identified as the most challenging aspect of bioanalytical LC-MS method development in terms of complexity, time and assay performance.

In this application, Oasis PRiME HLB, a reversed-phase solid phase extraction (SPE) sorbent with phospholipid removal was used for extraction of several top-selling pharmaceuticals in 2023 (Table 1) from plasma, employing a 3-step load-wash-elute SPE protocol. Excellent analyte recovery $\geq 80\%$ were achieved with matrix effects $\leq 15\%$.¹

Pharmaceutical drug trade name	Active pharmaceutical ingredient	Molecular weight (g/mol)	LogP	pKa	pKb
Veklury®	Remdesivir	602.58	2.01	10.23	0.65
Zetia®	Ezetimibe	409.40	4.14	9.48	-3.00

Experimental

LC Conditions

UPLC:	I-Class, FL with Column Manager (CMA)
Mobile phase A:	0.1% FA in Water
Mobile Phase B:	0.1% FA in ACN
Column:	ACQUITY UPLC HSS T3 100 Å, 1.8 µm 2.1 mm x 30 mm (p/n: 186003944)
Col temperature:	35 °C
Sample temperature:	10 °C
Inj. volume:	10 µl
Analysis time:	3.0 min
WNW:	90:10 Water:ACN + 0.1% FA
SNW:	25:25:25:25 Water:IPA:ACN:MeOH

MS Condition

MS:	Xevo TQ-XS
Capillary (kV):	2.0
Cone voltage:	32 V

Desolvation temp: 500 °C

Desolvation flow: 1100 L/Hr

Cone gas flow: 150 L/Hr

UPLC Gradient Table

Time (min)	Flow rate (mL/min)	% Mobile phase A	% Mobile phase B
0.0	0.6	100	0
0.2	0.6	100	0
2.0	0.6	10	90
2.3	0.6	10	90
2.4	0.6	100	0
3.0	0.6	100	0

Data Management: All data was acquired and analyzed using Waters MassLynx™ Software v. 4.1 and quantification performed using TargetLynx™ Software.

Materials: The small molecule pharmaceuticals were purchased from Selleckchem (<https://www.selleckchem.com>) and from Cayman Chemicals (<http://www.caymanchem.com> <<http://www.caymanchem.com>>) LC-MS grade formic acid, and phosphoric acid, were purchased from Sigma Aldrich (<http://www.sigmaaldrich.com> <<http://www.sigmaaldrich.com>>). Methanol and Acetonitrile were purchased from Honeywell (lab.honeywell.com).

Sample preparation and extraction

Stock solutions of each individual pharmaceutical (1 mg/mL) were prepared in a 50:50 water: methanol solution. Aliquots of each 1 mg/mL pharmaceutical stock solution were combined to yield working stock solution mixtures of 50, 10, and 1 µg/mL, respectively. Initial recovery and matrix effects evaluations were conducted using 0.5–1.0

µg/mL prepared in rat plasma. Calibration curve samples were prepared between 0.9–1,000 ng/mL. The SPE extraction protocol, using the Oasis PRiME SPE 96-Well µElution Plate, is shown in Figure 1.

Oasis PRiME HLB SPE Protocol
96-well plate, 3 mg sorbent per well,
P/N 186008052

Sample pretreatment:

200 µL 4% H₃PO₄ to 200 µL
plasma sample

Load:

400 µL pre-treated sample

Wash:

200 µL 95:5 Water: Methanol

Elute:

2 x 25 µL 90:10
Acetonitrile/Methanol

Dilute:

50 µL H₂O

Figure 1. Reversed-phase SPE extraction protocol for Oasis PRiME HLB in the 96-Well µElution format used for analyte extraction from plasma.

Pharmaceutical analyte recovery was calculated according to the following equation:

$$\%Recovery = \left(\frac{Area\ A}{Area\ B} \right) \times 100\%$$

Where Area A = the peak area of an extracted sample and Area B = the peak area of an extracted matrix sample in which the compounds were added post-extraction.

Matrix effects were calculated according to the following equation:

$$Matrix\ Effects = \left(\left(\frac{Peak\ area\ in\ the\ presence\ of\ matrix}{Peak\ area\ in\ the\ absence\ of\ matrix} \right) - 1 \right) \times 100\%$$

The peak area in the presence of matrix refers to the peak area of an extracted blank matrix sample in which the compounds were added post-SPE extraction. The peak area in the absence of matrix refers to analytes in a neat solvent solution comprised of the final SPE eluate composition injected for analysis. In this case, 90:10 acetonitrile:methanol (elution solution) diluted 1:1 with water.

Results and Discussion

LC/MS Analysis

LC-MS/MS analysis was performed using a Waters Xevo TQ-XS tandem quadrupole MS using an electrospray ionization (ESI) source and Multi Reaction Monitoring (MRM). The MS MRM transitions for each pharmaceutical are listed in Table 2. Chromatographic separation of these analytes were performed using an ACQUITY I-Class PLUS UPLC system and ACQUITY UPLC HSS T3 Column (p/n: 186003538 < <https://www.waters.com/nextgen/global/shop/columns/186003538-acquity-uplc-hss-t3-column-100a-18--m-21-mm-x-50-mm-1-pk.html>>). The column temperature was 35 °C. Gradient separation using 0.1% formic acid in water (MP A) and 0.1% formic acid in acetonitrile (MP B) was employed. Initial LC conditions used a flow rate of 0.6 mL/min and 100% MP A, which was held for 0.2 minutes, followed by an increase to 90% MP B over 1.8

minutes and then held 90% MP B for 0.3 minutes to flush the column and returned to starting gradient conditions at 2.4 minutes. Total analysis time was 3 minutes. Injection volume of the extracted samples was 10 μ L. An illustration of analyte chromatographic performance is illustrated in Figure 2.

Analyte	Electrospray ionization mode	MRM transition (m/z)	Collision energy (eV)
Remdesivir	+	603.6>228.9	20
		603.6>199.8	30
		603.6>317.7	20
Ezetimibe	-	408.2>271.0	35
Raltegravir	+	445.4>108.8	20
		445.4>360.8	15
		445.4>192.8	15
Rivaroxaban	+	436.9> 231.9	20
		436.9>144.8	20
Enzalutamide	+	465.4>208.9	20
		465.4>156.0	40
Ticagrelor	+	523.6>126.8	40
		523.6>152.8	40

SPE Extraction

The pharmaceutical analytes in this application were neutral and basic analytes, with pKa ranges between 7-13. In addition, their hydrophilicity, LogP values ranged from 1.3-4.14. These physiochemical properties are provided in Table 1. Use of Oasis PRiME HLB reversed-phase sorbent enabled the simultaneous extraction of these diverse analytes, with >80% recovery from plasma (Figure 3).

Oasis PRiME HLB is a novel reversed phase SPE sorbent developed to enable simpler and faster SPE protocols, while at the same time generating cleaner extracts than other traditional sample preparation methods.³ A key attribute of Oasis PRiME HLB, is the ability to remove > than 90% of endogenous phospholipids compared to traditional SPE and protein precipitation³⁻⁵. Selectively removing phospholipids aids in the reduction of their co-elution with analytes of interest, which then reduces the associated MS ion enhancement or suppression, and often results in lower matrix effects. In this application, resulting matrix effects ranged from -15.2 to 5.4%.

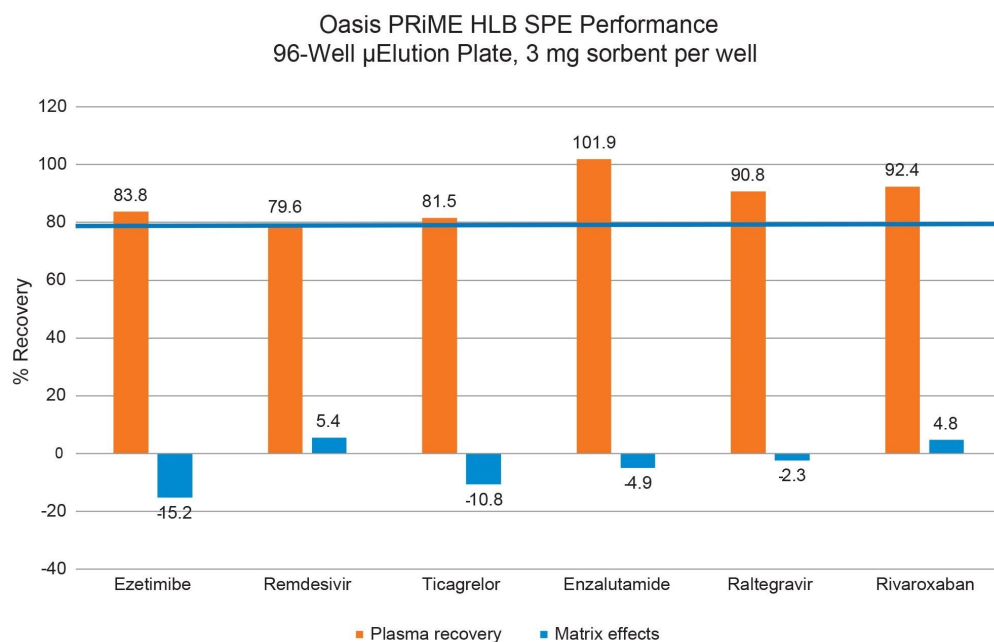

Figure 3. Representative recovery and matrix effects resulting from the extraction of the pharmaceutical analytes from plasma using the Oasis PRiME HLB in the 96-Well μ Elution format and SPE extraction protocol listed in Figure 1.

Bioanalytical Quantitation

Proof-of-concept bioanalytical quantification of the pharmaceutical analytes extracted from plasma using the Oasis PRiME HLB SPE is highlighted in Figure 4. Linear fit of calibration curves was >0.99 . Lower limit of quantification (LLOQ) for all pharmaceuticals was 0.91 ng/mL, while upper limit of quantification (ULOQ) was 500 ng/mL for remdesivir, ezetimibe, rivaroxaban, and enzalutamide. Raltegravir ULOQ was 250 ng/mL and 1000 ng/mL for ticagrelor. Accuracy of all calibration points was $\pm 15\%$.

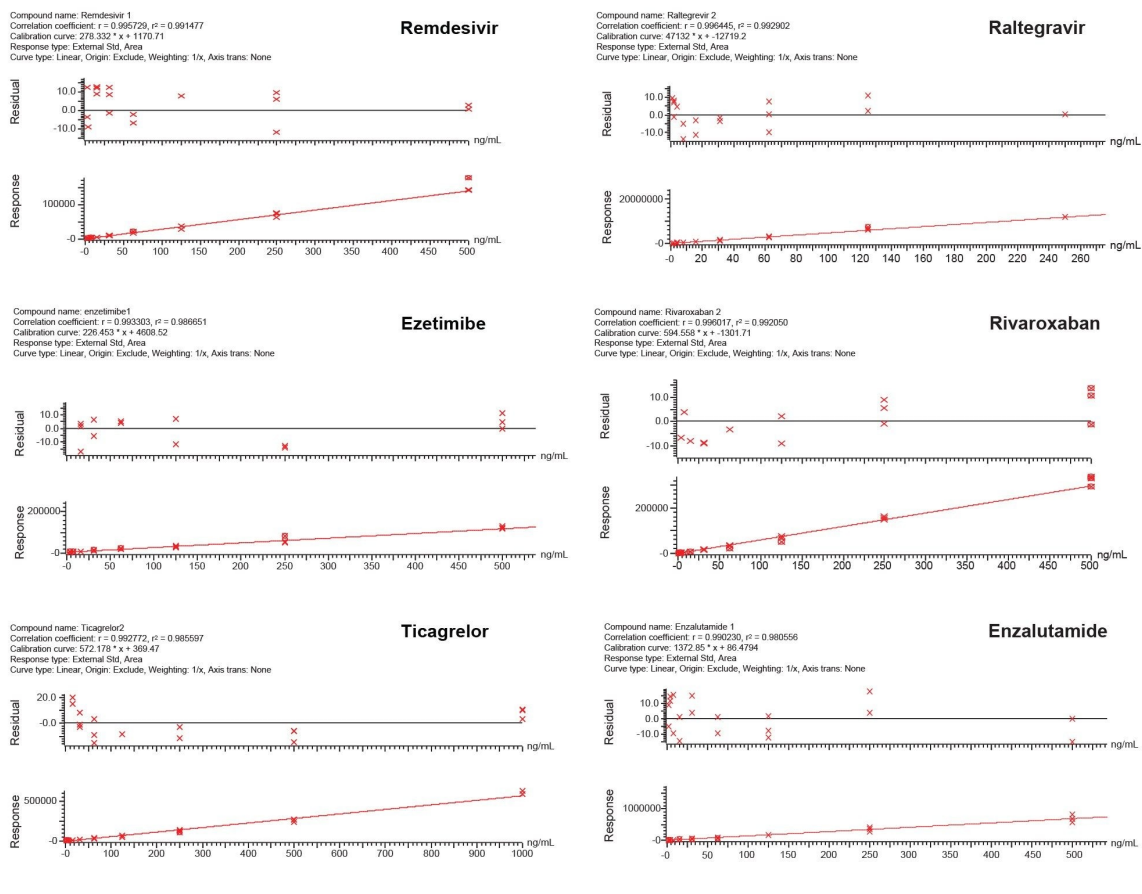

Figure 4. Representative quantification performance for the pharmaceutical analytes demonstrating linearity accuracy and precision across calibration points.

Conclusion

This application highlights the successful SPE extraction and LC-MS/MS quantification of several key small molecule pharmaceuticals from plasma using Oasis PRiME HLB SPE. Use of generic protocols greatly simplified sample preparation method development while also providing excellent extraction performance, achieving high analyte recovery (80%), low matrix effects ($\leq 15\%$), and removal of 90% of residual phospholipids in the extracted sample.
